Lightning Talk Proposal

Hockeystick: Visualizing Global Warming with R

Previously relegated to a niche corner of the investment landscape, the impact of global warming on financial markets has become an active topic of research and policy at central banks and financial regulators. For instance, the European Central Bank¹, the US Federal Reserve², and the Financial Stability Board³ all have active regulatory studies and pilot programs to measure and manage climate risks. In addition, the US Securities and Exchange Commission (SEC) has proposed requiring listed corporations to include enhanced climate disclosures in their statements⁴.

Accordingly, as the risk and returns from global warming enter the mainstream of finance, there is an urgent need for all practitioners to gain a basic understanding of the data and the mechanics of global warming. There are a multitude of publicly-available data sources regarding global warming from a large variety of academic and scientific organizations around the world, for example NASA, the European ECMWF, UK Met Office, the Japan Meteorological Service, to name but a few. For financial practitioners without climate training navigating these complex sources can be daunting and potentially error-prone.

The goal of the `hockeystick`⁵ R package is to make essential global warming datasets easily available in R to non-climate experts. `hockeystick` users can download the latest raw data from authoritative sources as well as view it via pre-defined ggplot2 charts. Datasets include atmospheric CO₂ and CH₄, carbon emissions, instrumental, reconstructed, and paleo ice-core temperature records, sea levels, hurricanes, and Arctic/Antarctic sea-ice. All data is compiled from authoritative, reliable, peer-reviewed sources and traceable to their original sources and documented. `hockeystick` does not store any data itself, but serves as an api wrapper to always obtain the most up-to-date data. Users may use the dataframes returned by the package functions or use the pre-defined charts for their own purposes.

The package is designed to facilitate extensibility and permit users to analyze and reuse the data as they see fit. During the lightning talk I propose to demonstrate the use of the package and its visualization capabilities. Some visual examples follow below.

Overall, as more entity-level climate data become available, I hope that the talk and package will allow conference attendees to place such data in the greater planetary-level climate context, and easily available in R to complement their standard workflows.

⁵hockeystick: Download and Visualize Essential Climate Change Data. <https://cran.r-project.org/package=hockeystick>; <https://cortinah.github.io/hockeystick/>

Package demo

Retrieve NOAA/ESRL Mauna Loa CO₂ Observatory concentration data and plot:

```
library(hockeystick)
ml_co2 <- get_carbon()
plot_carbon(ml_co2)
```

Atmospheric CO₂ (Keeling Curve)

Mauna Loa CO₂ monthly mean ppm

Source: NOAA/ESRL and Scripps Institution of Oceanography.
<https://gml.noaa.gov/ccgg/trends/data.html>

Retrieve GCP global CO₂ emissions and plot:

```
emissions <- get_emissions()
plot_emissions(emissions)
```

Fossil Combustion CO₂ Emissions

World

Source: Global Carbon Project and Our World In Data.
<https://github.com/owid/co2-data>

```
plot_emissions_with_land(emissions)
```

Source: Global Carbon Project and Our World In Data.
<https://github.com/owid/co2-data>

Visualize cumulative emissions by country:

```
emissions_map()
```

1900–2021 Cumulative CO₂ Emissions by Country

Source: Global Carbon Project and Our World In Data

Retrieve NASA/GISS global surface temperature anomaly data and plot:

```
anomaly <- get_temp()
plot_temp(anomaly)
```

Visualize warming using Ed Hawkins styled “warming stripes”:

```
warming_stripes()
```

Global surface temperature anomaly
Relative to 1951–1980 average

Retrieve tide gauge and satellite sea level data and plot:

```
gmsl <- get_sealevel()
plot_sealevel(gmsl)
```

Retrieve July annual Arctic Sea Ice Index and plot:

```
seaice <- get_seaice()
plot_seaice(seaice)
```

`get_seaice()` arguments can be modified to download Antarctic sea ice, and allow any month.

You can also visualize sea ice by month and year:

```
arcticice <- get_icecurves()
plot_icecurves(arcticice)
```

Retrieve Common Era temperature reconstruction and plot it with instrumental record:

```
anomaly2k <- get_temp2k()
plot_temp2k(anomaly2k)
```

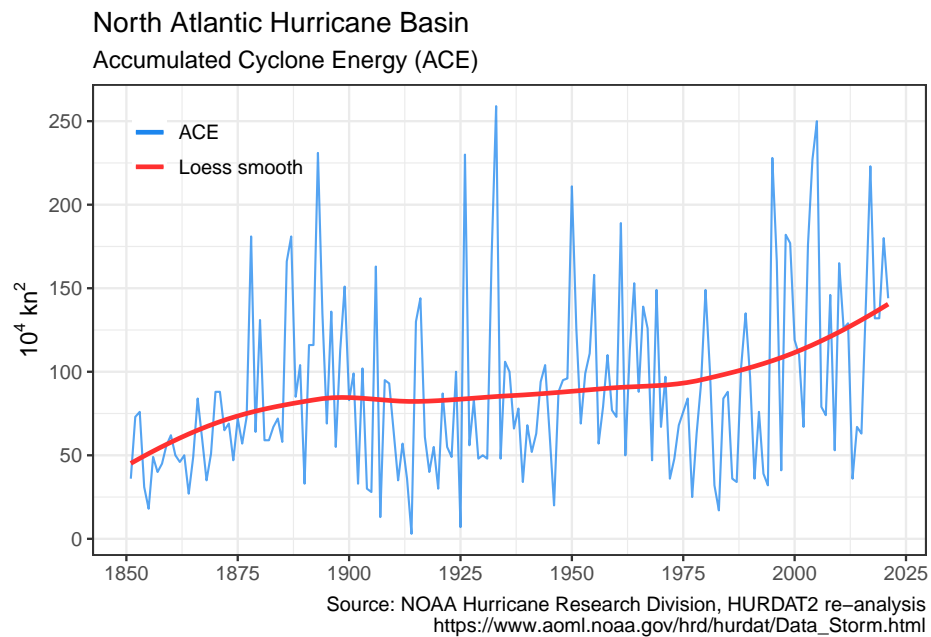

Retrieve NOAA HURDAT2 hurricane data and plot:

```
hurricanes <- get_hurricanes()
plot_hurricanes(hurricanes)
```

```
plot_hurricane_nrg(hurricanes)
```

Retrieve NOAA/ESRL CH₄ Globally averaged mean data and plot:

```
ch4 <- get_methane()
plot_methane(ch4)
```

Retrieve Vostok paleo ice core data and plot:

```
vostok <- get_paleo()
plot_paleo(vostok)
```

Paleoclimate: The Link Between CO₂ and Temperature

420,000 years from the Vostok ice core, Antarctica.
